

Unmasking Readmission

Cost-Sensitive, Transparent Knowledge Discovery for 30-Day
Hospital Readmission in Diabetic Patients

Table of Contents

- 1 Introduction
- 2 Data Strategy & Exploration
- 3 Methodology: Preprocessing & Modeling
- 4 Cost-Sensitive Evaluation Framework
- 5 Findings & Recommendations
- 6 Conclusion

- **Industry Challenge:** Inability to predict short-term patient readmissions leads to:
 - Misdiagnosed severity
 - Suboptimal resource allocation
 - Financial penalties under HRRP¹
- **Project Goal:** Predictive and Perscriptive analysis of 30-day readmission risk in diabetic patients
 - Transparent methods, for trust
- **Expected Impact:**
 - Methods which are both interpretable and performative
 - Actionable insights for decision-making

¹Strack et al. 2014.

Task Overview

- **Source:** Diabetes 130-US Hospitals dataset (1999-2008), Cerner Health Facts.
- **Target Variable Formulation:** Binary classification aligning with HRRP penalty windows:
 - **Positive (High-Risk):** < 30 days readmission (Minority class: 11%)
 - **Negative (Low-Risk):** > 30 days or NO readmission

- **Identified Gaps to Address:**

- “Black-box” ensemble models (e.g., XGBoost) lack the clinical transparency required for actionable healthcare decisions.

- **Data Manipulation Hurdles:**

- **Class Imbalance:** Only 11% of records for the readmission case.
- **Sparsity:** Many missing, non-estimatable values
- **High Cardinality:** 100's of medical codes; domain knowledge to combine.
- **Leaky Variables:** Patient codes non-unique; some discharges indicate mortality.

- **Existing Research Lacks:**

- punishment of false negatives²
- inpatient vs. outpatient medications³
- focus on transparent models⁴
- production of rule sets for clinical use⁵

Table of Contents

- 1 Introduction
- 2 Data Strategy & Exploration
- 3 Methodology: Preprocessing & Modeling**
- 4 Cost-Sensitive Evaluation Framework
- 5 Findings & Recommendations
- 6 Conclusion

- **Feature Engineering:** Proposing new clinical variables.
- **Addressing Imbalance:** Accurately model the minority class via:
 - SMOTE
 - Cost-Sensitive Reweighting

Modeling: Interpretability vs. Performance

- **Our Approach:** Benchmark top models and interpretable, rule-based algorithms.
- **Candidate Models/Systems:**
 - *Transparent Base:* Logistic Regression, Decision Trees.
 - *Rule-Induction:* PRISM / Association Rules (human-readable logic).
 - *Black-Box Top Performer:* XGBoost.
 - *SHAP:* for black-box model interpretation.

- 3 Methodology: Preprocessing & Modeling
- 4 Cost-Sensitive Evaluation Framework**
- 5 Findings & Recommendations
- 6 Conclusion

Why Accuracy Isn't Enough

- **Metrics/Systems:**

- *Stratified CV*: avoid leakage.
- *AUPRC*: for rare events
- *Kappa*: for dataset skew
- *Brier Score*: for true clinical likelihood

The Cost-Sensitive Framework

- **False Negative (Missed High-Risk):** High Cost. Patient readmits within 30 days, triggering heavy HRRP financial penalties and resource strain.
- **False Positive (Unnecessary Intervention):** Low-to-Moderate Cost. Enrolling a patient in preventive care (e.g., follow-up calls) who wouldn't have readmitted.
- **Goal:** Optimize the threshold to minimize overall financial and operational cost, not just classification error.

- 6 Conclusion

Initial Scores (Without the Tricks)

- Dataset imbalance is a significant challenge; AUC-ROC handles the class imbalance best. This shows the importance of attribute elimination and identifying the classes correlating with the target.

- **Clinical Application:** Transitioning from “black-box scoring” to transparent risk triggers enables targeted preventive resource allocation at discharge.
- **Recommendation:** Deploy an interpretable rule-set overlay to flag high-risk discharges, balancing intervention costs against HRRP penalty risks.

Table of Contents

- 1 Introduction
- 2 Data Strategy & Exploration
- 3 Methodology: Preprocessing & Modeling
- 4 Cost-Sensitive Evaluation Framework
- 5 Findings & Recommendations
- 6 Conclusion

Conclusion & Next Steps

- **Summary:** Shifted focus from raw prediction to Cost-Sensitive Knowledge Discovery, providing interpretable rules to mitigate HRRP readmission penalties.
 - Focus: raw prediction to cost-sensitive discovery
 - Provide interpretable rules for clinicians
- **Next Steps in Analysis:**
 - Whittle away at the attributes for better fit and interpretability.

Thank You!
